TCP Commands used:

- 1) Http_1080 : sudo tcpdump tcp port 1080 -w http_1080.pcap
- 2) Tcp_1081 : sudo tcpdump tcp port 1081 -w tcp_1081.pcap
- 3) Tcp_1082: sudo tcpdump tcp port 1082 -w tcp_1082.pcap

High Level view of the code:

First I have stored all the possible combinations of source port and destination port in a dictionary and also I have stored the different source ports in a separate list. For each of the port in that list, I am checking for any GET request and if I find it I am printing the req tuple for that request and also I am storing the corresponding Response objects in another dictionary and then based on the port numbers I am printing each of them as required.

Part C:

q1)

Request 1

Procedure to calculate:

As explained in the above overview

q2) If the number of requests is 1 or 2 then the protocol is HTTP 2.0 If the number of requests is 6 or 7 then the protocol is HTTP 1.1 If the number of requests is more than that then the protocol is HTTP 1.0

q3) The factors for various sites are:

1) HTTP 1.0:

Time taken is : 0.538012981415 Num of bytes is : 2179249 Number of pkts is :522

2) HTTP 1.1:

Time taken is: 0.348621845245 Num of bytes is: 2193393 Number of pkts is: 489

3) HTTP 2.0:

Time taken is : 5.25183987617 Num of bytes is : 2199586 Number of pkts is :345

From the above we observe that

Fastest : HTTP 1.1 Slowest : HTTP 2.0 Most pkts : HTTP 1.0

Most Raw bytes: HTTP 2.0 Least pkts: HTTP 2.0

Least Raw bytes: HTTP 1.0

Time is calculated as the difference between the timestamps of the first byte and the last byte

Pkts are counted as the number of payloads

Total bytes are counted as the sum of length of all payloads
